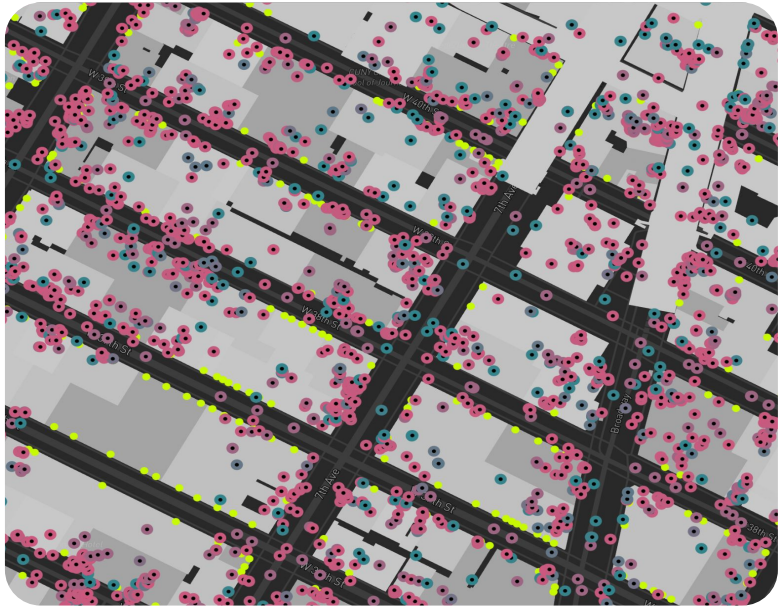
OVERTURE MAPS FOUNDATION

D

Location & Positional Accuracy

Spotting the error



Overture releases a new global map every month

Yet, we haven’t tackled the problem of spatial repositioning

Your Mission

Goal: Prototype a spatial repositioning system

How: Assess different definitions of pin locations of a place; Build a ground truth dataset (n=500-1k) and assess the current spatial offset; Prototype modeling approaches to reposition a place

Data: Use a provided sample of ~5k Overture places

Research Questions

Definitions: What are suitable pin locations? What are their strengths and weaknesses?

Measurement: Based on your ground truth - what is the offset in Overture's places data? What is the best way to measure this?

Modelling: What are modeling approaches to select the right location? How can we discretize space? What are relevant features?

Impact & Deliverables

You'll deliver

1. Working definition of where the pin location should be
2. Report of estimated offset
3. Prototype and recommendation for future work

You'll learn

- Constrained problem definition
- Spatial data analysis
- Rapid prototyping
